

ACE-031

ACE-031 is a recombinant fusion protein that acts as a myostatin inhibitor. Myostatin is a negative regulator of muscle growth, and by blocking its activity, ACE-031 promotes increased muscle mass and strength. It is primarily studied for its potential in treating muscle-wasting diseases and enhancing muscle development in both clinical and athletic settings.

Benefits of ACE-031

Muscle Growth and Hypertrophy:

Increases lean muscle mass and improves strength.

Athletic Recovery and Injury Support:

Enhances tissue repair and maintains muscle volume.

Age-Related Sarcopenia:

Improves strength and functionality in older adults.

Treatment of Muscle-Wasting Conditions:

Helps patients retain mobility and quality of life during illness.

Support During Immobilization or Bedrest:

Helps preserve muscle mass in orthopedic or postoperative patients.

*Starting at \$205 a treatment. Treatments can be once a month for 1-6 months, once a week for 4-12 weeks, or 1 shot 2 times a week for 4-12 weeks. Prices are subject to change. *
