

KISSPEPTIN

Kisspeptin is a naturally occurring peptide hormone that plays a critical role in regulating the reproductive system by initiating the release of gonadotropin-releasing hormone (GnRH). It is essential for the onset of puberty, regulation of fertility, and has been linked to various reproductive health conditions. Additionally, Kisspeptin has shown potential in modulating mood, sexual behavior, and anxiety, offering promising avenues for therapeutic uses beyond reproductive health.

Benefits of Kisspeptin;

- Helps in treating infertility, supports assisted reproductive techniques (ART), and regulates menstrual cycles in women experiencing hormonal imbalances.
- Enhances libido, sexual motivation, and may improve sexual function in both men and women experiencing low sexual desire or arousal issues.

- Helps to alleviate anxiety, particularly related to reproductive health and sexual behavior, promotes emotional well-being.
- Supports the maturation of ovarian follicles. Improves ovulatory cycles and may enhance fertility outcomes.
