

PE-22-88

PE-22-28 is a synthetic peptide derived from a portion of the neuropeptide galanin, specifically the 22nd to 28th amino acid sequence. This peptide has been studied for its neuroprotective properties and its potential impact on mood regulation, cognitive function, and neurodegenerative conditions. By modulating the galanin receptors, PE-22-28 plays a key role in stress resilience, anxiety reduction, and overall mental well-being.

Benefits of PE-22-28

Anxiety Reduction:

Promotes a calming effect, reduces anxiety levels, and improves overall stress resilience.

Depression

Management:

Alleviates depressive symptoms, improves mood, and enhances mental well-being.

Cognitive Enhancement:

Supports memory retention, improves focus, and may help mitigate cognitive decline.

Neuroprotection:

Helps preserve neuronal health, reduces the progression of neurodegenerative diseases, and supports overall brain function.

Stress Resilience:

Reduces the physical and psychological effects of stress, promoting mental clarity and calmness under pressure.
